Outline

- 1 Motivation
- 2 Term Structure
- 3 Path Indexing
- 4 Discrimination Trees
- 5 Substitution Trees
- 6 Experiment

Refutation

Clausal form

$$\{ P(f(x)) \vee f(x) \not\approx a, g(x, y) \approx a \vee \neg Q(x, y), \mathcal{C}_3 \}$$

$$\equiv$$

$$\forall x (P(f(x)) \vee f(x) \not\approx a)$$

$$\wedge$$

$$\forall xy (g(x, y) \approx a \vee \neg Q(x, y))$$

$$\wedge$$

$$\forall \text{Var}(\mathcal{C}_3) (\mathcal{C}_3)$$

Goal

A sound and refutation complete calculus.

Resolution (without equality)

Resolve and factor all clauses and literals in an unsatisfiable set

$$\frac{A \vee \mathcal{C} \quad \neg B \vee \mathcal{D}}{(C \vee D)\sigma} (\sigma) \text{ resolution} \qquad \frac{A \vee B \vee \mathcal{C}}{(A \vee C)\sigma} (\sigma) \text{ factoring}$$

$$\sigma = \text{mgu}(A, B)$$

and the empty clause will be derived eventually.

Observation

Usually the set grows too fast to obtain a result.

Goal

A sound, refutation complete, and *effective* calculus.

- 1 *Reduce* search space
 - Ordered Resolution, Strategies, ...
 - ... with selection functions for clauses and literals
- 2 *Reduce* redundancy
 - e.g. discard clauses that are subsumed by other clauses
 - ... depending on the calculus

Example (forward subsumption)

$$S = \{^1P(x, y), ^2\neg P(a, z)\} \cup \{^3P(a, z')\}$$

t_1 subsumes t_3

$$\frac{P(x, y) \quad \neg P(a, z)}{\square} \quad \{x \mapsto a, y \mapsto z\}$$

Resolution

$$S \perp = \{P(\perp, \perp), \neg P(a, \perp), P(a, \perp)\}$$

InstGen / SMT

Goal

A sound, refutation complete, and effective calculus.

3 Quickly find

- *variants*
- *instances*
- *generalizations*
- *unifiable terms*

variant removal
backward subsumption
forward subsumption
resolution, demodulation

of a query term in a given set of terms.

Observation

Deduction rate drops quickly with sequential search.

Term Indexing

Data structures and algorithms for fast retrieval of matching terms.

Definition (Position Strings)

$$\mathcal{Pos}^{\Sigma}(t) = \begin{cases} \{\langle \epsilon, x \rangle\} & \text{if } t = x \in \mathcal{V} \\ \{\langle \epsilon, f \rangle\} \cup \{\langle ip, s \rangle \mid \langle p, s \rangle \in \mathcal{Pos}^{\Sigma}(t_i)\} & \text{if } t = f(t_1, \dots, t_n) \end{cases}$$

Term traversals

$$\mathcal{Pos}^{\Sigma}(h(f(a, y))) = \{\langle \epsilon, h \rangle, \langle 1, f \rangle, \langle 11, a \rangle, \langle 12, y \rangle\}$$

$\langle \epsilon, h \rangle \langle 1, f \rangle \langle 12, y \rangle$ path from root to leaf
 $\langle \epsilon, h \rangle \langle 1, f \rangle \langle 11, a \rangle \langle 12, y \rangle$ pre-order traversal

Variables

Variants of terms generate the same position strings

- if variable names are ignored
- or normalized

$$f(y, z) \Rightarrow \langle \epsilon, f \rangle \langle 1, * \rangle \langle 2, * \rangle$$

$$f(y, z) \Rightarrow \langle \epsilon, f \rangle \langle 1, x_1 \rangle \langle 2, x_2 \rangle$$

$$f(y, y) \Rightarrow \langle \epsilon, f \rangle \langle 1, x_1 \rangle \langle 2, x_1 \rangle$$

In the first case even non-variants of terms generate the same strings.

Notation

We abbreviate

- path strings $\langle \epsilon, h \rangle \langle 1, f \rangle \langle 12, * \rangle$ h.1.f.2.*
- and traversal strings $\langle \epsilon, h \rangle \langle 1, f \rangle \langle 11, * \rangle \langle 12, * \rangle$ h.f.a.*
when traversal order and arities of symbols are fixed.

Build

$$t_1: h(f(x, y)), t_2: h(f(x, a)), t_3: h(f(a, a))$$

$$t_1 \Rightarrow \{h.1.f.1.*, h.1.f.2.*\}$$

$$t_2 \Rightarrow \{h.1.f.1.*, h.1.f.2.a\}$$

$$t_3 \Rightarrow \{h.1.f.1.a, h.1.f.2.a\}$$

Retrieve

$$^{t_1}h(f(x, y)), ^{t_2}h(f(x, a)), ^{t_3}h(f(a, a))$$

$$h(f(z, b))) \Rightarrow \{h.f.*, h.f.b\}$$

$$u : h(f(z, b)) \mapsto \{t_1, t_2, t_3\} \cap \{t_1\}$$

$$i : h(f(z, b)) \mapsto \{t_1, t_2, t_3\} \cap \{\}$$

$$g : h(f(z, b)) \mapsto \{t_1, t_2\} \cap \{t_1\}$$

$$v : h(f(z, b)) \mapsto \{t_1, t_2\} \cap \{\}$$

$$v : h(f(z, z)) \mapsto \{t_1, t_2\} \cap \{t_1\}$$

Unit Superposition Inference Rules

$$\frac{s \approx t \quad L[s']}{(L[t]) \cdot \sigma} \quad \begin{array}{l} \text{unit} \\ \text{paramodulation} \end{array}$$

where $\sigma = \text{mgu}(s, s')$, $s' \notin \mathcal{V}$, $t\sigma \neq s\sigma$

$$\frac{s \approx t \quad u[s'] \not\approx v}{(u[t] \not\approx v) \cdot \sigma} \quad \begin{array}{l} \text{unit} \\ \text{superposition} \end{array} \quad \frac{s \approx t \quad u[s'] \approx v}{(u[t] \approx v) \cdot \sigma}$$

where $\sigma = \text{mgu}(s, s')$, $s' \notin \mathcal{V}$, $t\sigma \neq s\sigma$, $v\sigma \neq u[s']\sigma$

$$\frac{s \not\approx t}{\square} \quad \begin{array}{l} \text{unit equality} \\ \text{resolution} \end{array}$$

$$\frac{A \quad \neg B}{\square} \quad \begin{array}{l} \text{unit} \\ \text{resolution} \end{array}$$

where s and t (A and B respectively) are unifiable

$$t_4: f(x, a) \approx x$$

$$t_1: h(f(x, y)), t_2: h(f(x, a)), t_3: h(f(a, a))$$

$$^{t_1}h(f(x, y)), ^{t_2}h(f(x, h(a))), ^{t_3}h(f(h(a), a))$$

$$t_1 \Rightarrow \text{h.f.*.*}$$

$$t_2 \Rightarrow \text{h.f.} * \text{h.a}$$

$$t_3 \Rightarrow \text{h.f.h.a.a}$$

Retrieve

$$^{t_1:}h(f(x, y)), ^{t_2:}h(f(x, h(a))), ^{t_3:}h(f(h(a), a))$$

$$h(f(x', a)) \Rightarrow h.f.*.a$$

$$u : \mathbf{h}(f(x', \mathbf{a})) \mapsto \{t_1, t_3\}$$

$$i : \mathbf{h}(\mathbf{f}(x', \mathbf{a})) \mapsto \{t_3\}$$

$$g : h(f(x', a)) \mapsto \{t_1\}$$

$$v : \mathbf{h}(\mathbf{f}(x', \mathbf{a})) \mapsto \{ \}$$

$$^{t_1}h(f(x, y)), ^{t_2}h(f(x, h(a))), ^{t_3}h(f(h(a), a))$$

Build

$$^{t_1}h(f(x, y)), ^{t_2}h(f(x, h(a))), ^{t_3}h(f(h(a), a)), ^{t_4}h(f(a, a)))$$

$$\downarrow$$

$$*_0 \mapsto h(*_1)$$

$$\downarrow$$

$$*_1 \mapsto f(*_2, *_3)$$

$$\swarrow \quad \searrow$$

$$*_2 \mapsto x \quad *_3 \mapsto a$$

$$\begin{array}{cc} \swarrow \quad \searrow & \swarrow \quad \searrow \\ *_3 \mapsto y & *_3 \mapsto h(a) & *_2 \mapsto h(a) & *_2 \mapsto a \\ t_1 & t_2 & t_3 & t_4 \end{array}$$
